Duration of Antibiotic Treatment in Community-Acquired Pneumonia

A Multicenter Randomized Clinical Trial

Ane Uranga, MD; Pedro P. España, MD; Amaia Bilbao, MSc, PhD; Jose María Quintana, MD, PhD; Ignacio Arriaga, MD; Maider Intxausti, MD; Jose Luis Lobo, MD, PhD; Laura Tomás, MD; Jesus Camino, MD; Juan Nuñez, MD; Alberto Capelastegui, MD, PhD

Uranga A. JAMA Intern Med 2016; 176: 1257-1265

Objective: To validate IDSA/ATS guidelines for duration of antibiotic treatment in hospitalized patients with CAP.

Design and Setting: Multicenter, noninferiority, RCT. Four teaching hospitals in Spain (January 1, 2012 – August 31, 2013).

Intervention: A total of 312 patients were randomized at day 5 to an intervention (ATBs for a minimum of 5 days) or control group (duration of ATBs determined by physicians).

Primary outcome: Clinical success rate at days 10 and 30 after admission and CAP-related symptoms at days 5 and 10 (18-item CAP symptom questionnaire score range, 0-90).

Uranga A. JAMA Intern Med 2016

Duration of antibiotic treatment in CAP
A multicenter randomized clinical trial

Outcome Intent-to-treat analysis	Control n= 150	Intervention n= 162	P value
Clinical success, n (%)			
At day 10	71 (49)	90 (56)	0.18
At day 30	132 (89)	147 (92)	0.33
CAP symptom questionnaire score, mean (SD)			
At day 5	24.7 (11)	27.2 (12)	0.10
At day 10	18.6 (9.0)	17.9 (8)	0.69

The new antibiotic mantra "Shorter is Better"

Infections for which short-course therapy has been shown to be equivalent in efficacy to longer therapy

	Treatment, Days	
Disease	**Short**	**Long**
Community-acquired pneumonia[1-3]	3-5	7-10
Nosocomial pneumonia[6,7]	≤8	10-15
Pyelonephritis[10]	5-7	10-14
Intraabdominal infection[11]	4	10
Acute exacerbation of chronic bronchitis and COPD[12]	≤5	≥7
Acute bacterial sinusitis[13]	5	10
Cellulitis[14]	5-6	10
Chronic osteomyelitis[15]	42	84

Clinical features and prognostic factors of listeriosis: the MONALISA national prospective cohort study

Caroline Charlier, Élodie Perrodeau, Alexandre Leclercq, Benoît Cazenave, Benoît Pilmis, Benoît Henry, Amanda Lopes, Mylène M Maury, Alexandra Moura, François Goffinet, Hélène Bracq Dieye, Pierre Thouvenot, Marie-Noëlle Ungeheuer, Mathieu Tourdjman, Véronique Goulet, Henriette de Valk, Olivier Lortholary, Philippe Ravaud, Marc Lecuit, on behalf of the MONALISA study group

Charlier C. Lancet Infect Dis 2017; 17: 510-519

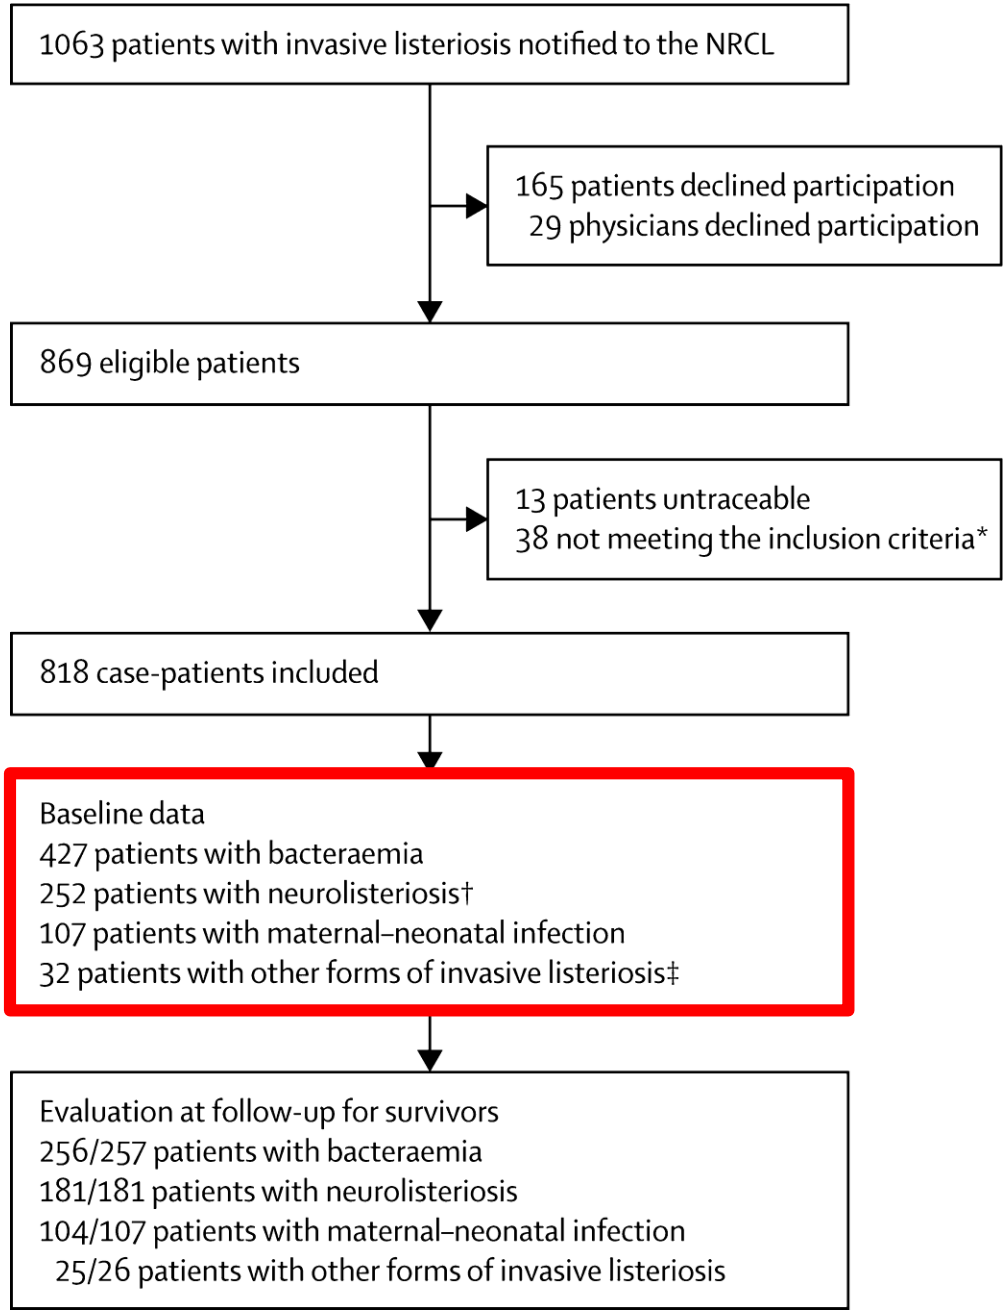
Objective: To characterize clinical features and prognostic factors of listeriosis.

Design and Setting: Nationwide prospective observational study in France (MONALISA). Microbiologically proven cases declared to the National Center for *Listeria* (Nov 2009 – July 2013).

Patients: 818 cases from 372 centers.

Measurements: Clinical features, characterization of isolates, and determination of predictors of 3-month mortality or persisting impairment using logistic regression.

Charlier C. Lancet Infect Dis 2017



1063 patients with invasive listeriosis notified to the NRCL
165 patients declined participation
29 physicians declined participation
869 eligible patients
13 patients untraceable
38 not meeting the inclusion criteria*
818 case-patients included
Baseline data
427 patients with bacteraemia
252 patients with neurolisteriosis†
107 patients with maternal–neonatal infection
32 patients with other forms of invasive listeriosis‡
Evaluation at follow-up for survivors
256/257 patients with bacteraemia
181/181 patients with neurolisteriosis
104/107 patients with maternal–neonatal infection
25/26 patients with other forms of invasive listeriosis

Neonatal Bacteremia Neurolisteriosis

Outcomes			
Intensive care unit management	2/107 (2%)	89/427 (21%)	152/252 (60%)
Median hospital stay (days)	6 (4–11)	15 (7–24)	23 (15–33)
Mechanical ventilation	0	43/427 (10%)	83/252 (33%)
Multi-organ failure	0	75/427 (18%)	49/252 (19%)
Aggravation of any pre-existing organ dysfunction	0	182/427 (43%)	58/252 (23%)
3-month mortality	0	194/427 (45%)	75/252 (30%)
Median interval from diagnosis to 3-month mortality (days)	..	10 (3–23)	14 (5–30)
3-month in-hospital mortality§	0	170/427 (40%)	69/252 (27%)
Median interval from diagnosis to 3-month in-hospital mortality (days)	..	7 (2–19)	11 (5–24)
Post-hospitalisation follow-up	104/107 (97%)	256/257 (99%)	181/181 (100%)
Median post-hospitalisation follow-up (months)	5 (3–9)	5 (3–11)	5 (3–13)
3-month post-hospitalisation mortality	..	24/257 (9%)	6/181 (3%)
Median interval from diagnosis to 3-month post-hospitalisation mortality (days)	..	54 (24–68)	62 (58–68)
New infection during post-hospitalisation period¶	0	19/255 (7%)	7/181 (4%)
Recurrence of listeriosis‖	0	2/255 (1%)	1/179 (1%)

Impact of Intravenous Immunoglobulin on Survival in Necrotizing Fasciitis With Vasopressor-Dependent Shock: A Propensity Score–Matched Analysis From 130 US Hospitals

Sameer S. Kadri,[1,2] Bruce J. Swihart,[3] Stephanie L. Bonne,[4] Samuel F. Hohmann,[5,6] Laura V. Hennessy,[7] Peter Louras,[7] Heather L. Evans,[7] Chanu Rhee,[8] Anthony F. Suffredini,[1] David C. Hooper,[2] Dean A. Follmann,[3] Eileen M. Bulger,[7] and Robert L. Danner[1]

Kadri SS. Clin Infect Dis 2017; 64: 877 - 885

Background: IVIG is sometimes administered for presumptive TSS, but its frequency of use and efficacy are unclear.

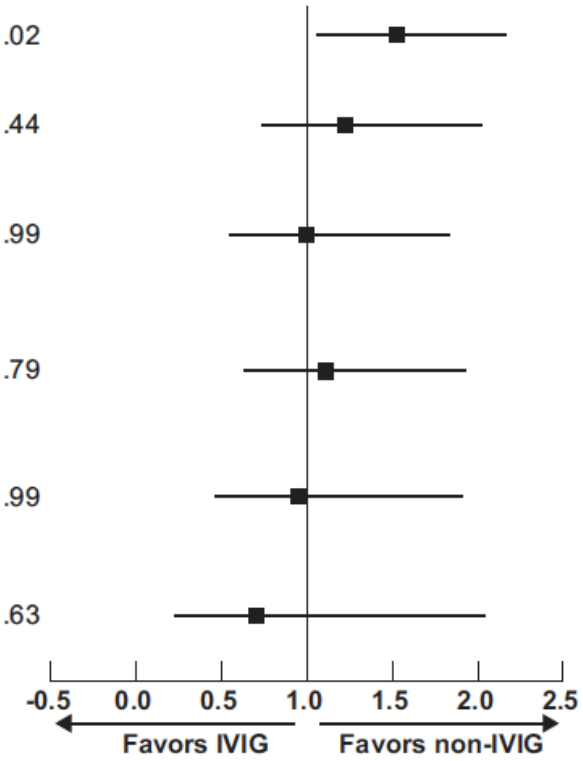
Methods: Adult patients with NF and vasopressor-dependent shock undergoing surgical debridement (2010-2014) were identified at 130 US hospitals. IVIG cases were propensity-matched and risk-adjusted.

Outcome: The primary outcome was in-hospital mortality and the secondary outcome was median LOS.

Kadri SS.Clin inefct Dis 2017

Of 4127 cases of debrided NF with shock , 164 (4%) received IVIG

Comparison of NF shock cases	IVIG Cases No.	IVIG Cases Mortality (%)	Non-IVIG Cases No.	Non-IVIG Cases Mortality (%)	*P* Value
All cases; unadjusted	164	26.8	3963	19.4	.02
Matched pairs, unadjusted	161	27.3	161	23.6	.44
Matched pairs adjusted by multivariable logistic regression*	161	27.3	161	23.6	.99
Matched pairs, treated with clindamycin†	153	26.3	153	25	.79
Matched pairs receiving IVIG within 2 days†	90	28.9	90	30	.99
Matched pairs coded for TSS, GAS, and/or SA†	56	16.1	56	21.4	.63



In-hospital mortality did not differ between matched IVIG and non-IVIG groups (27.3% vs 23.6%; adjusted OR, 1.00; 95% CI, 0.55 – 1.83)

Median LOS was similar between groups (26 vs 26; p= 0.84)

Timing of surgical antimicrobial prophylaxis: a phase 3 randomised controlled trial

Walter P Weber, Edin Mujagic*, Marcel Zwahlen, Marcel Bundi, Henry Hoffmann, Savas D Soysal, Marko Kraljević, Tarik Delko, Marco von Strauss, Lukas Iselin, Richard X Sousa Da Silva, Jasmin Zeindler, Rachel Rosenthal, Heidi Misteli, Christoph Kindler, Peter Müller, Ramon Saccilotto, Andrea Kopp Lugli, Mark Kaufmann, Lorenz Gürke, Daniel Oertli, Evelin Bucheli-Laffer, Julia Landin, Andreas F Widmer, Christoph A Fux, Walter R Marti*

Weber WP. Lancet Infect Dis 2017; 17: 605 – 614.

Background: The precise optimum timing for the administration of SAP for the prevention of SSI is unknown.

Design and Setting: Phase 3, randomized, controlled superiority trial. General surgery adult inpatients at two Swiss hospitals (2013 - 2015).

Intervention: 5580 pts were randomly assigned to receive SAP early or late; 1.5 g IV cefuroxime (plus 500 mg metronidazole in colorectal surgery).

Primary outcome: SSI within 30 days of surgery.

Weber WP. Lancet Infect Dis 2017

Median administration time was 42 min before incision in the early group (IQR 30 – 55) and 16 min before incision in the late group (IQR 10 – 25)

	SAP in anaesthesia room, early administration (n=2296)*	SAP in operating room, late administration (n=2300)*	Odds ratio (95% CI)	p value†
Primary outcome				
Surgical site infection	113 (5%)	121 (5%)	0·93 (0·72–1·21)	0·601
Superficial incisional infection	48 (2%)	55 (2%)	0·87 (0·59–1·29)	0·491
Deep incisional infection	23 (1%)	20 (1%)	1·15 (0·63–2·11)	0·642
Organ space infection	42 (2%)	46 (2%)	0·91 (0·60–1·39)	0·673
Secondary outcomes				
All-cause 30-day mortality	29 (1%)	24 (1%)	1·21 (0·70–2·09)	0·485
Median length of hospital stay, days	5·1 (3–9)	5·0 (3–10)	NA	0·375

Weber WP. Lancet Infect Dis 2017

Effect of appropriate combination therapy on mortality of patients with bloodstream infections due to carbapenemase-producing Enterobacteriaceae (INCREMENT): a retrospective cohort study

Belén Gutiérrez-Gutiérrez, Elena Salamanca*, Marina de Cueto, Po-Ren Hsueh, Pierluigi Viale, José Ramón Paño-Pardo, Mario Venditti, Mario Tumbarello, George Daikos, Rafael Cantón, Yohei Doi, Felipe Francisco Tuon, Ilias Karaiskos, Elena Pérez-Nadales, Mitchell J Schwaber, Özlem Kurt Azap, Maria Souli, Emmanuel Roilides, Spyros Pournaras, Murat Akova, Federico Pérez, Joaquín Bermejo, Antonio Oliver, Manel Almela, Warren Lowman, Benito Almirante, Robert A Bonomo, Yehuda Carmeli, David L Paterson, Alvaro Pascual, Jesús Rodríguez-Baño, and the REIPI/ESGBIS/INCREMENT Investigators†*

Gutierrez-Gutierrez B. Lancet Infect Dis 2017; April 22 (Epub ahead of print)

Objective: To investigate the effect of appropriate therapy and appropriate combination therapy on mortality of patients with BSI due to CPE.

Design: Retrospective cohort study of patients with clinically significant monomicrobial BSIs due to CPE from the INCREMENT cohort (01/2004 – 12/2103).

Setting: 26 tertiary hospitals in ten countries.

Primary outcome: 30 day all-cause mortality.

Gutierrez-Gutierrez B. Lancet Infect Dis 2017

Bezlotoxumab for Prevention of Recurrent *Clostridium difficile* Infection

M.H. Wilcox, D.N. Gerding, I.R. Poxton, C. Kelly, R. Nathan, T. Birch, O.A. Cornely, G. Rahav, E. Bouza, C. Lee, G. Jenkin, W. Jensen, Y.-S. Kim, J. Yoshida, L. Gabryelski, A. Pedley, K. Eves, R. Tipping, D. Guris, N. Kartsonis, and M.-B. Dorr, for the MODIFY I and MODIFY II Investigators*

Wilcox MH. New Engl J Med 2017; 376: 305 - 317

Rationale: Actoxumab and bezlotoxumab are monoclonal antibodies against CD toxins A and B, respectively.

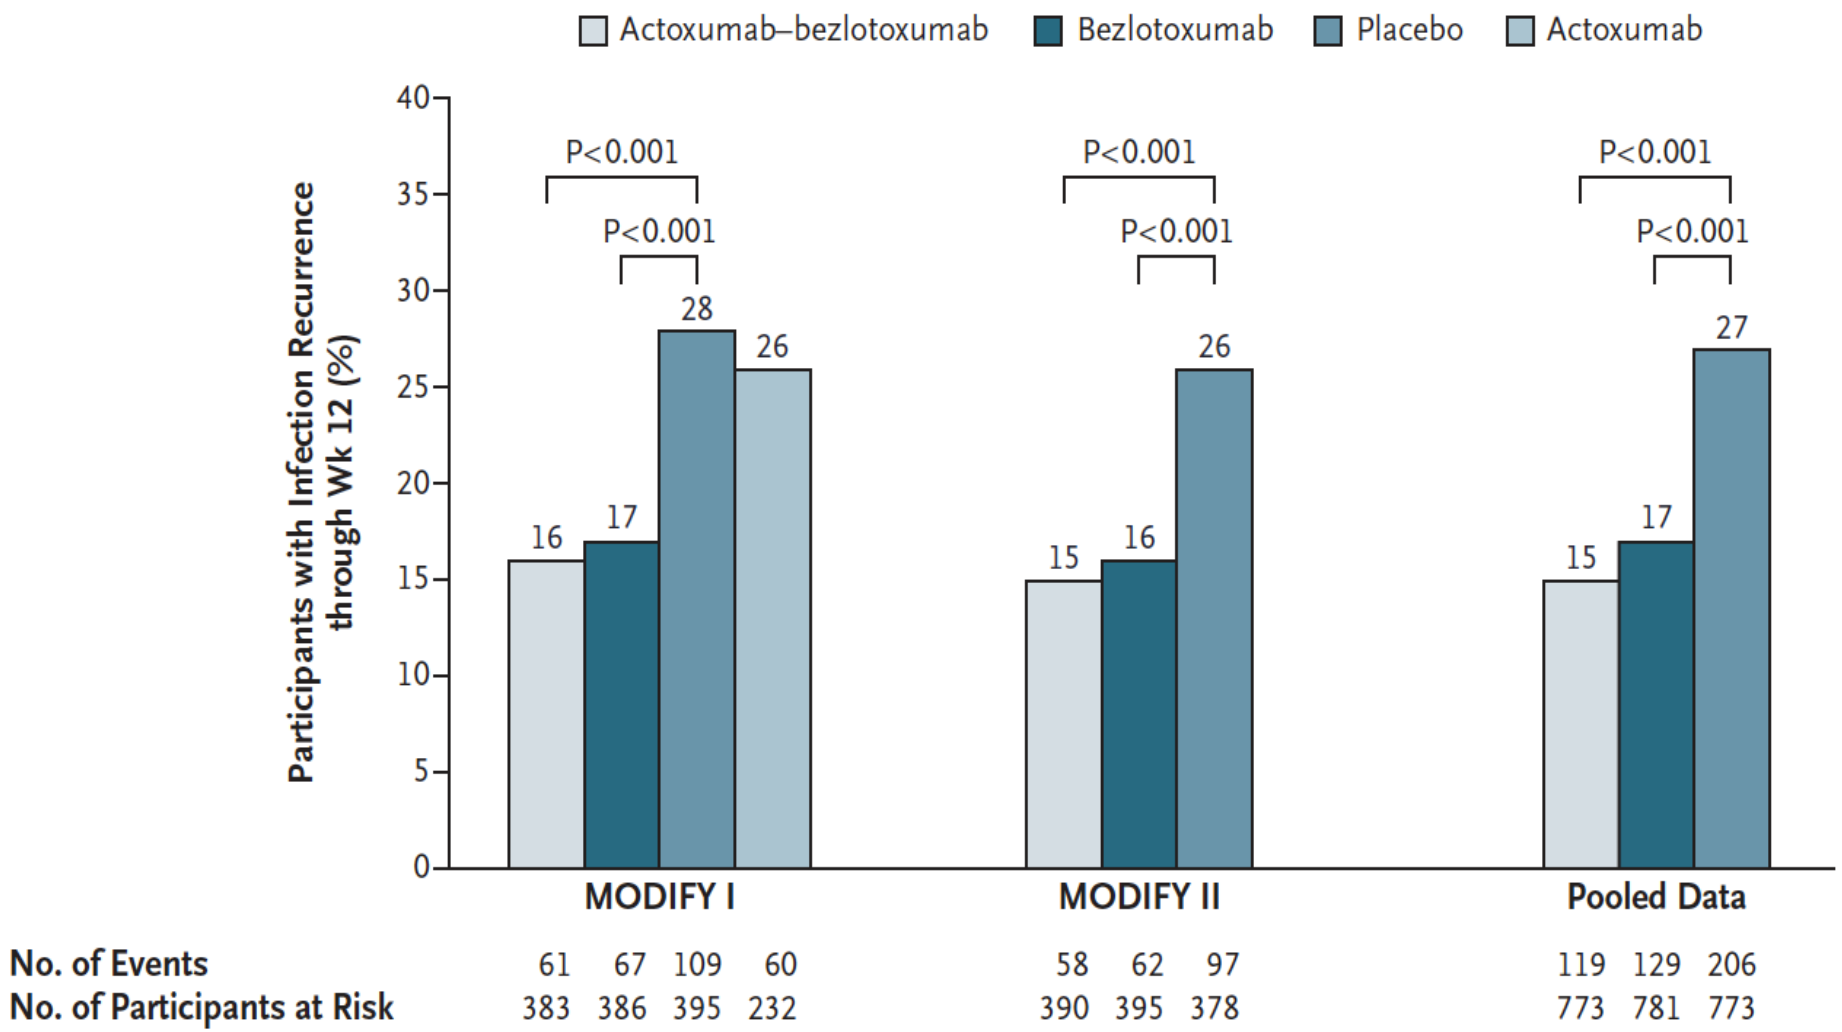
Design: Two double-blind, randomized, placebo-controlled, phase 3 trials (MODIFY I and MODIFY II); 322 sites in 30 countries (2011-15).

Patients: 2655 adults received an infusion of bezlotoxumab (10 mg/Kg), actoxumab plus bezlotoxumab (10 mg/Kg each), or placebo.

Primary end point: Recurrent infection within 12 weeks (MIT).

Wilcox MH. New Engl J Med 2017

Participants with recurrent CDI during the 12 week follow-up period



Rate of recurrent CDI for patients randomized to three treatment arms, using pooled data from two randomized trial (MODIFY I and MODIFY II)

Enhanced terminal room disinfection and acquisition and infection caused by multidrug-resistant organisms and *Clostridium difficile* (the Benefits of Enhanced Terminal Room Disinfection study): a cluster-randomised, multicentre, crossover study

Deverick J Anderson, Luke F Chen, David J Weber, Rebekah W Moehring, Sarah S Lewis, Patricia F Triplett, Michael Blocker, Paul Becherer, J Conrad Schwab, Lauren P Knelson, Yuliya Lokhnygina, William A Rutala, Hajime Kanamori, Maria F Gergen, Daniel J Sexton; for the CDC Prevention Epicenters Program

Anderson DJ. Lancet 2017; 389: 805-814

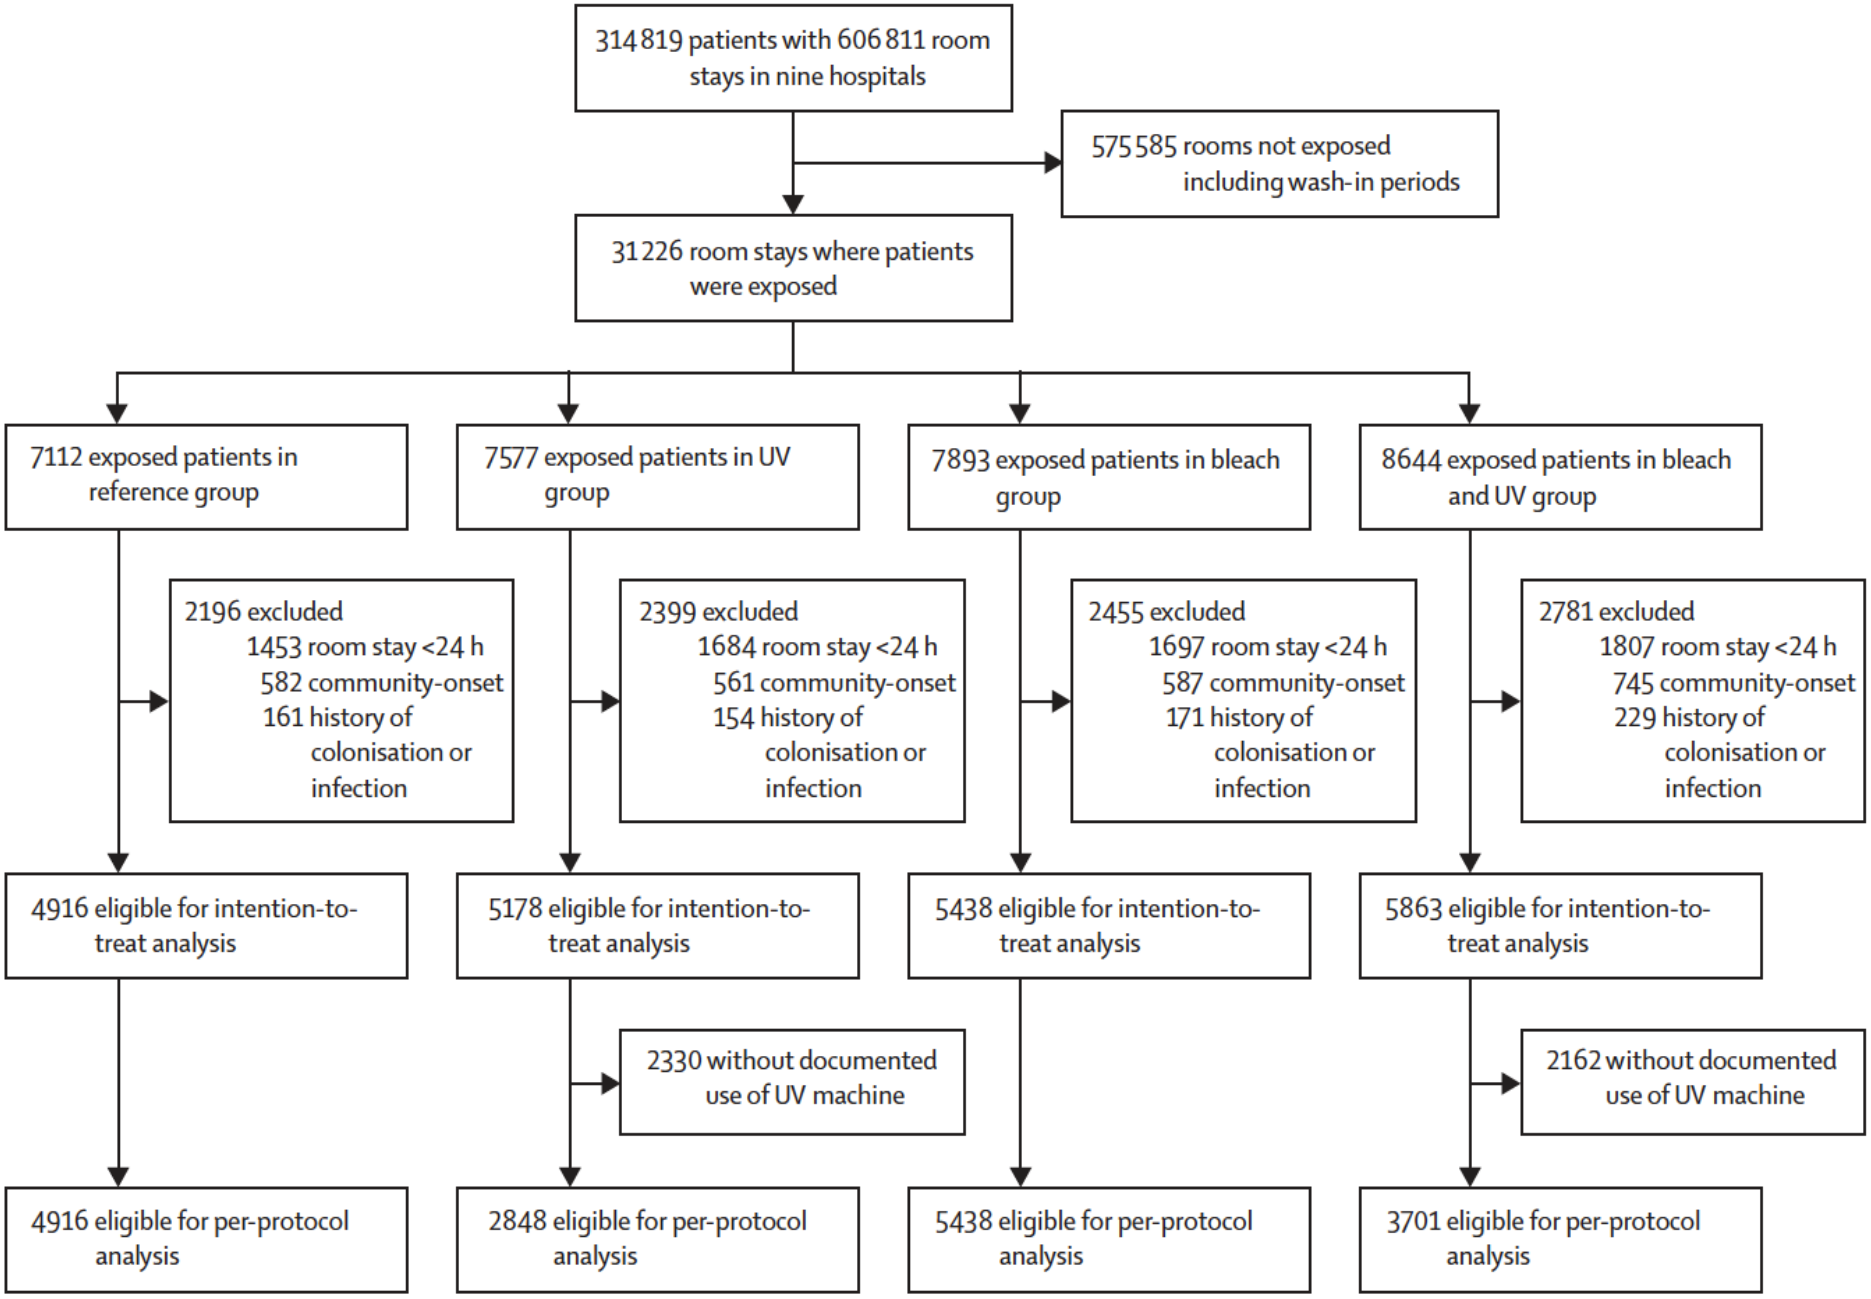
Objective: To determine the effect of three enhanced strategies for terminal room disinfection (disinfection of a room between occupying patients) on acquisition and infection due to MRSA, VRE, *C. difficile*, and MDR *Acinetobacter*.

Design and Setting: Pragmatic, cluster-randomized, crossover trial at nine hospitals in the USA.

Interventions: Reference (quaternary ammonium), UV (quaternary ammonium and UV light), Bleach, and Bleach and UV light.

Primary outcome: incidence of infection or colonization with all targeted organisms among exposed patients.

Anderson DJ. Lancet 2017



314 819 patients with 606 811 room stays in nine hospitals
575 585 rooms not exposed including wash-in periods
31 226 room stays where patients were exposed
7112 exposed patients in reference group

Intention-to-treat analysis (RR/ 95% CI)

Organisms	Reference	UV	Bleach	Bleach and UV
All targeted organisms	Reference	0.70 (0.50-0.98)	0.85 (0.69-1.04)	0.91 (0.76-1.09)
C. difficile	-	-	Reference	1.00 (0.57-1.75)
MRSA	Reference	0.78 (0.58-1.05)	1.00 (0.82-1.21)	0.97 (0.78-1.22)
VRE	Reference	0.41 (0.15-1.13)	0.43 (0.19-1.00)	0.36 (0.18-0.70)

Patients admitted to rooms previously occupied by pts harboring target organism were 10-30 % less likely to acquire the same organism if the room was terminally disinfected using and enhanced strategy.

The largest reduction occurred when UV light device was added to the standard disinfectant strategy.

UK investigation to assess risk of invasive *M. chimaera* infection in cardiothoracic surgery and a possible association with cardiopulmonary bypass heater-cooler units following alerts in Switzerland and the Netherlands.

- Identification of cardiovascular by-pass associated *M. chimaera* infection through national laboratory and hospital admission data linkage.
- Cohort study to assess patient risk
- Microbiological and aerobiological investigations of heater-coolers *in situ* and under controlled laboratory conditions
- Whole-genome sequencing of clinical and environmental isolates.

Chand M. Clin Infect Dis 2017

Table 1. Clinical Characteristics of Probable Cases of Severe *Mycobacterium chimaera* Infection Associated With Cardiopulmonary Bypass Surgery, United Kingdom

Characteristic	All Cases (N = 18)
Female sex, No. (%)	5 (28)
Median age (range), y	63 (7–81)
Type of surgery, No. (%)	
Aortic valve replacement	14 (77)
Mitral valve replacement	3 (17)
Aortic valve replacement and homograft to pulmonary valve (redo)	1 (6)
Site of infection, No. (%)	
Sternal osteomyelitis	2 (11)
Anterior mediastinal abscess	1 (6)
Spinal osteomyelitis and discitis	1 (6)
Endocarditis	5 (28)
Endocarditis, aortic root abscess	3 (17)
Endocarditis, disseminated infection	3 (17)
Disseminated infection	3 (17)
Median time between surgery and presentation (range), y	1.15 (0.25–5.1)
Median time between presentation and first mycobacterial culture (range), d	85 (6–457)
Outcome, No. (%)	
Death	9 (50)
Recovered	2 (11)
Remains unwell and on treatment	7 (38)
Median time between culture and death (range), d	71 (14–567)

54 patients with *Candida auris* infection

- Pakistan, India, South Africa, and Venezuela
- Period: 2012 to 2015
- Median age: 54 years (7% of neonates)
- Predisposing conditions:

  DM (41%), recent surgery (51%), CVC (73%)
- Receiving systemic antifungals when *C. auris* was isolated: 41%
- The median time from admission to infection: 19 days
- Bloodstream infection: 61%
- All-cause in-hospital mortality: 59%

Lockart SR. Clin Infect Dis 2017

Antifungal	MIC Range, µg/mL	MIC_{50}, µg/mL	MIC_{90}, µg/mL
Fluconazole	4–256	128	256
Voriconazole	0.03–16	2	8
Itraconazole	0.125–2	0.5	1
Posaconazole	0.06–1	0.5	1
Caspofungin	0.03–16	0.25	1
Anidulafungin*	0.125–16	0.5	1

Empirical Micafungin Treatment and Survival Without Invasive Fungal Infection in Adults With ICU-Acquired Sepsis, *Candida* Colonization, and Multiple Organ Failure

The EMPIRICUS Randomized Clinical Trial

Jean-Francois Timsit, MD, PhD; Elie Azoulay, MD, PhD; Carole Schwebel, MD, PhD; Pierre Emmanuel Charles, MD, PhD; Muriel Cornet, PhamD; Bertrand Souweine, MD, PhD; Kada Klouche, MD, PhD; Samir Jaber, MD, PhD; Jean-Louis Trouillet, MD, PhD; Fabrice Bruneel, MD; Laurent Argaud, MD, PhD; Joel Cousson, MD; Ferhat Meziani, MD, PhD; Didier Gruson, MD, PhD; Adeline Paris, PharmD; Michael Darmon, MD, PhD; Maité Garrouste-Orgeas, MD, PhD; Jean-Christophe Navellou, MD; Arnaud Foucrier, MD; Bernard Allaouchiche, MD, PhD; Vincent Das, MD; Jean-Pierre Gangneux, PharmD, PhD; Stéphane Ruckly, MSc; Daniele Maubon, MD, PhD; Vincent Jullien, PharmD; Michel Wolff, MD, PhD; for the EMPIRICUS Trial Group

Timsit JF. JAMA 2016; 316: 1555 - 1564

Objective: To determine whether empirical micafungin reduces IFI-free survival at day 28.

Design and Setting: Randomized, double-blind placebo controlled trial, of 260 critically ill patients with ICU-acquired sepsis, multiple Candida colonization, multiple organ failure, and exposed to broad-spectrum antibacterial agents in 19 French ICUs (2012 – 2015).

Interventions: Empirical treatment with micafungin (100 mg once daily, for 14 days) vs placebo.

Primary outcomes: Survival without proven IFI at 28 days.

Timsit JF. JAMA 2016

Comparison of IFI-free survival at day 28

	Micafungin		Placebo			
	Survived at Day 28, No.	Total No.	Survived at Day 28, No.	Total No.	Hazard Ratio (95% CI)	*P* Value
